

Intelligent call centre management

An important means of increasing productivity and profitability is the implementation of an automatic call distribution (ACD) system. In companies with a high volume of incoming telephone calls, economic success is heavily dependent on how quickly customers can get in touch with you. Telephone contact with customers is therefore a top priority.

Often a high volume of incoming calls means a percentage of those calls will be either not answered or engaged. With an ACD system in place, otherwise lost calls can be queued and allocated to agents as they become available increasing the number of calls accepted and maximising the use of your resources.

Call volumes, answer times, agent performance and queue activity are all vital information for the efficient operation of any call centre. Real-time information is used to manage resources and queues, while historical reports are used to analyse, plan and promote the call centre.

Calyx® is a powerful reporting tool for your ACD system providing real-time and detailed statistics for optimising customer service. In conjunction with the Siemens HiPath and its high-speed CSTA interface, Calyx® provides supervisors with real-time information on agents, groups, calls and queues as well as a suite of historical reports to display past performance and loading.

Main features

- real-time snapshots of current queue & call information
- continuous moving chart of queue & call activity
- Real-time agent statistics
- Real-time call status & type
- Display agent's time in current queue
- Dual-level alarm monitoring for threshold & alarm conditions
- Real-time queue statistics including the number of calls, longest waiting time, average answer time, continuous-display graphs for answer times & calls in queue
- Real-time group statistics including the number of agents logged in, available & in wrap-up
- Historical reporting on queue, agent, call & call centre statistics

Monitor agents & groups in real-time . . .

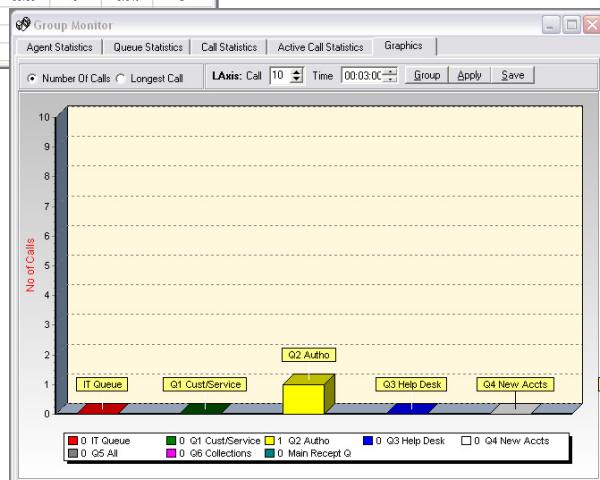

Monitor agents in all queues or monitor agents in individual queues simultaneously.
Agents monitors can be customised to display only the information you want to see.
